

# Regional adaptation of soybean production in Germany

**Jürgen Recknagel**

LTZ Augstenberg, Ast. Emmendingen; Dt. Sojaförderring

Workshop on 'Plant Proteins – Agronomic practices and environmental benefits', Bucharest, 12.06.2018

# What makes soybeans so interesting?

Product-quality and –yield:

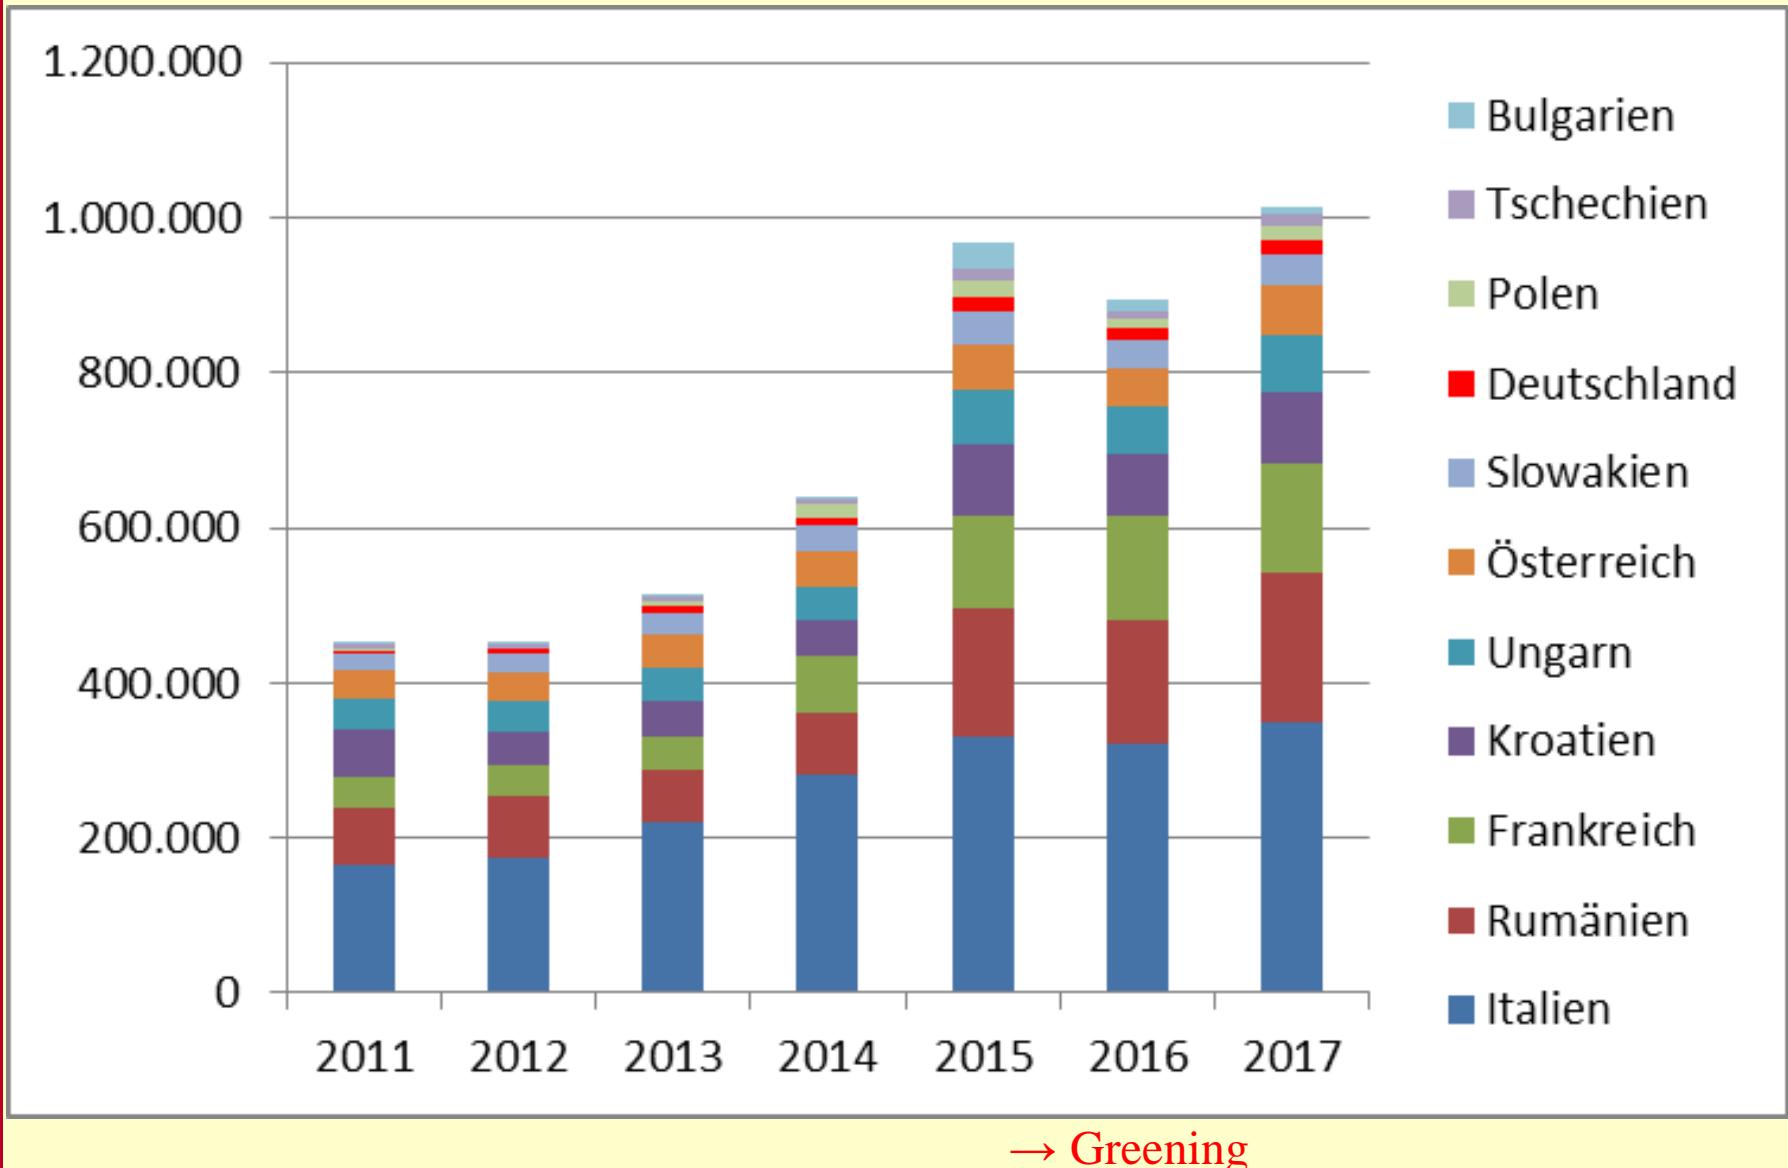

- Protein content (Concentration) + Oil
- Protein quality (top of vegetable)
- Protein yield (often highest/ha)  
→ often better than peas, faba beans and lupins

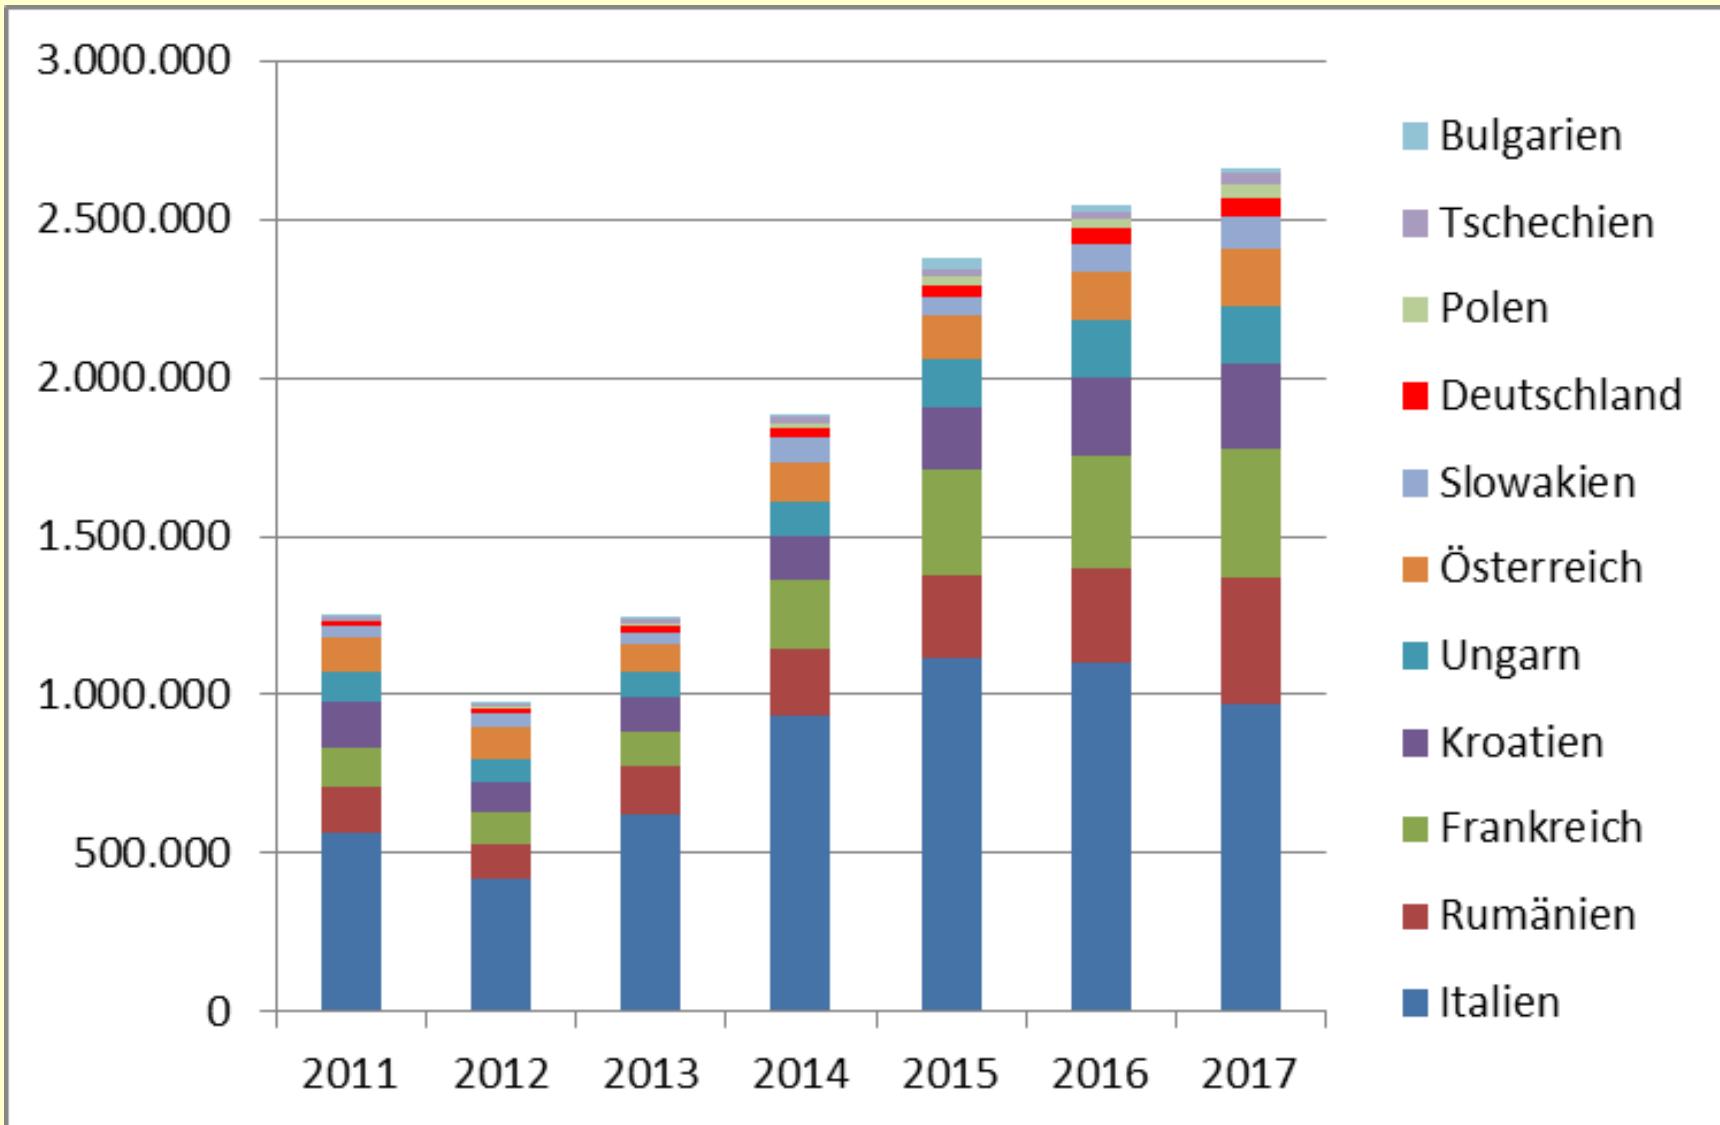

Frugal about fertilizers and plant protection:

- No nitrogen input (→ nodules fix 200-300kg N)
- No direct P-K-fertilization necessary
- Not much pesticide (few infections and pests)
- Enrichment of cereal-rotations.
- Quite resistant against climatic stress

Rel. 100 = 45,2 dt/ha

# Soybean yields in Germany

- Are more reliable than those of
  - other grain legumes
  - than corn (without irrigation)
- Are concurrential to non-GMO world market production (even without special subsidies)
- Contribute to balance meteorological risks within Europe (Western-/Middle-/Eastern)
- Are satisfying market demand for regionally produced food without GMO
- Seed multiplication in Germany reduces the risks of multiplication within Europe

# Site quality for Soybean cultivation: factors

# Overall suitability for soy cultivation (warmth+irradiation x water x soil)

# Transformation and Processing units for soybeans in Germany

# Processing/Transformation of Soybeans in Germany

- There are quite some transformers of soybeans (food) in Germany, but only few of them buy directly from farmers.
- During the last 10 years have been installed more and more small and medium size processing units for heat treatment of soybeans in southern Germany (some with oil pressing facilities) for feeding poultry and pigs with local feed (→ regional marketing)
- Since 2017 big oil-extraction factories of ADM along the Danube and Rhine-river have been converted to process GMO-free soybeans from Europe  
→ New dimension + new, until now non existing quality  
(HP meal without oil)

# What are the challenges of soybean cultivation?

Requirements to warmth and water

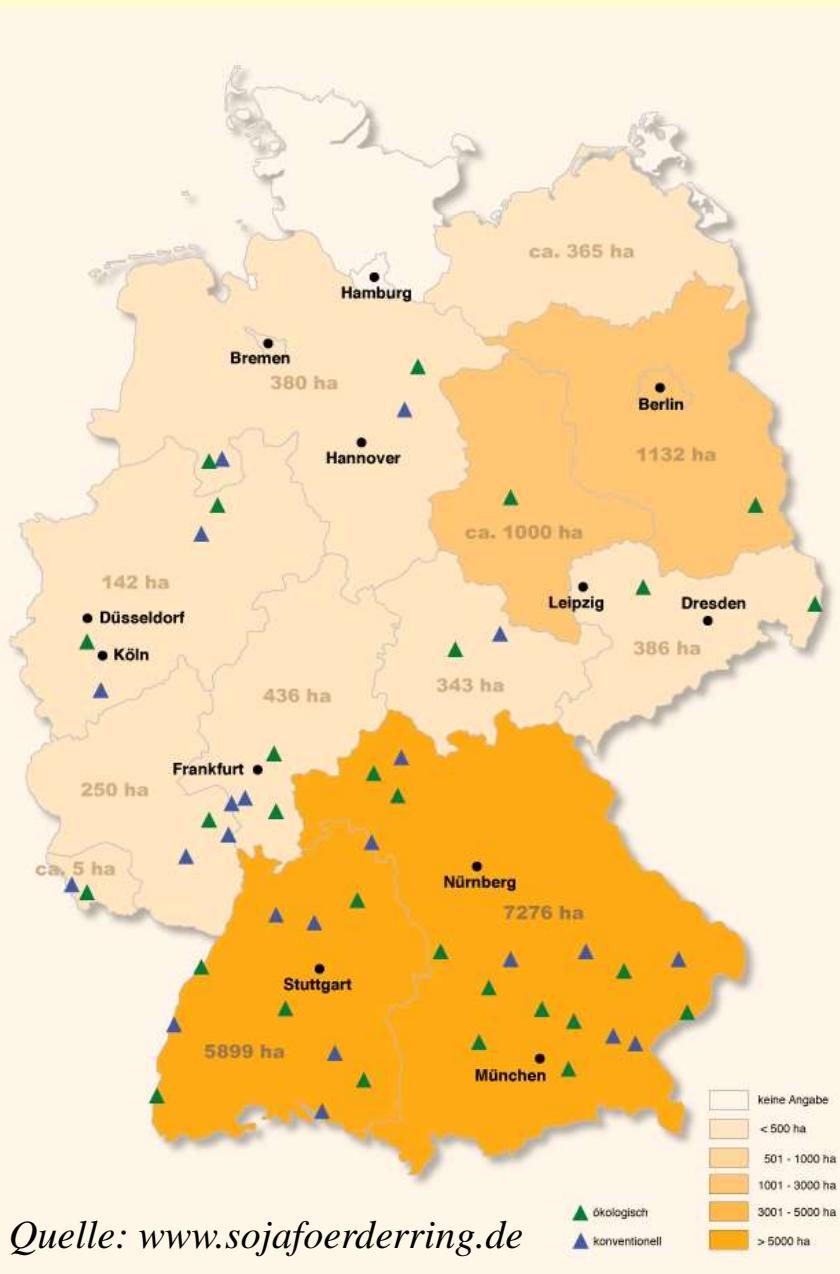

- climate
- soil
- (irrigation)

Requirements for cultivation and use

- Seed
- Weeding
- Harvest
- Utilisation

# Soy-Network: Pilot farms 2015

Objectives:  
Know how transfer  
Data mining  
Value chain development

120 farms: **50 pilot farms**  
and 70 demonstration farms  
in 11 regions of Germany  
46% conv. / 54% organic

Project partners:  
Bavaria: LfL, LVÖ  
Bad.-Württ.: LTZ, Taifun  
+ 11 more

Financing:  
BLE in the framework of  
German protein plant strategy

<b>Reifegruppe 00 (früh; für Rheintal und Weinbauklima)</b>								<b>31,7</b>	<b>11,04</b>	<b>dt/ha=100%</b>
Korus	2011	h	5	4	2	4	sh	102,7	113,4	Tofu-Sorte bei guter Wasserversorgung
SY Eliot	2013	h	5	4	4	2	m	109,4	107,8	ertragsstabile Sorte
Primus	2006	h	5	4	3	1	sh	98,1	107,3	Tofu-Sorte bei knapperer Wasserversorgung
ES Mentor	2010	h	7	5	2	3	h	112,0	116,7	nicht für trockene Lagen, empfindlich gegen Metribuzin
Silvia PZO	2012	d	8	3	5	4	n	113,4	106,3	nur wärmste, trockene Standorte

<sup>1</sup> Quelle: Beschreibende Sortenliste Österreich 2015, geändert

**Reife:** 1=sehr früh...8=sehr spät; **Nabelfarbe:** h=hell; d=dunkel; m=mittel; **Rohproteingehalt:** n=niedrig; m=mittel; h=hoch; sh=sehr hoch; **Rel-Erträge:** Ackerbaugebiet Südwest; Versuchsstandorte: Orschweier, Müllheim, Bönnigheim, Eiselaubailfingen (alle BW); Fritzlar (HE); Griesheim, Nieder-Hilbersheim, Herxheim, Biedesheim (alle RP)

# Weed control → herbicides

- Pre emergence treatment is essential!
  - **Sencor WG / Artist:** Chenopodium + Atriplex  
(Metribuzin 700 g/kg / Metribuzin 175 g/kg + Flufenacet 240 g/kg)
  - **Stomp aqua** (Pendimethaline 455 g/l): may be not tolerated in case of infiltration after heavy rainfall! (especially in combination with Sencor)
  - **Spectrum:** Panics, Amaranth, Solanum nigr.  
(Dimethenamid-P 720g/l)
  - **Centium CS:** Cleavers, Polygonaceous plants  
(Clomazone 360 g/l)
- Post emergence only for correction
  - **Harmony** (Thifensulfuron 480,6 g/kg), ... Dicots
  - **Clearfield Clentiga** (Imazamox 12,5 g/l +Quinmerac 250 g/l): Dicots
  - **Fusilade MAXX** (Fluzifop-P), **Focus ultra** (Cycloxydime): Panics

# Weed Control: pre-emergence

- 1,5 – 2 kg/ha Artist (Metribuzin 175 g/kg + Flufenacet 240 g/kg)  
+ 0,2 – 0,25 l/ha Centium 36 CS (Clomazone 360 g/l)
- 0,3 – 0,4 kg/ha Sencor WG (Metribuzin 700 g/kg)  
+ 0,6 – 0,8 l/ha Spectrum (Dimethenamid-P 720g/l)  
+ 0,25 l/ha Centium 36 CS (Clomazone 360 g/l)  
(+ 0,4 l/ha Herbosol for better tolerance)
- dose has to be adapted in order of clay- and humus-content of the soil!

# Harvest

# For a harvest without problems...

- Maturity must be verified regularly from start of leave-fall beginning/mid of **September**
- Prepare harvest combine when beans make sound in pods whilst agitating
- **Harvest at 15-13% humidity**; in October may be at 20-25%
- Exploit sunny hours of early afternoon!  
→ Humidity can come down by 5% from morning to afternoon!
- Correct regulation of combine (**experienced driver**)!  
→ Cutting bar as low as possible above the ground – no ear-lifter!  
Rotational frequency down – open cage – much wind:  
→ no broken beans – no pods!
- Axial-combines with **flexible cutting bar** (and wind-reel) are best!

## Diverse Anbauratgeber

Anbauempfehlungen des Deutschen Sojaförderring zum Download: [Umfassende Anleitung](#) und [in Stichworten](#)

[Sorten- und Pflanzenschutzinfos](#) des LTZ Augustenberg. Soja auf S.30/31.

Die französische [Terres Inovia](#) bietet auf ihrer Website umfassende, sehr aktuelle Informationen rund um den französischen (Bio-) Sojaanbau:

[Guide de culture soja bio 2017](#)

[Guide de culture soja 2017](#)

Umfassender, reich bebildeter [Anbauratgeber von Donausoja](#) mit detaillierter Krankheits- und Schädlingsbeschreibung.

Auf dem brandaktuellen Sojaportal der [Iowa Soybean Association](#) bekommt man einen guten Eindruck davon, was in den USA in Sachen Sojaanbau läuft.

Die Iowa State University hat bereits in den Sechzigern eine sehr brauchbare Beschreibung aller Entwicklungsstadien der Sojapflanze vorgelegt: [How a Soybean Plant Develops](#) (PDF, 9 MB)

# Cultivation potential (economically)

- Yield relation (Soy: Maize, Wheat, Rapeseed,...) considering crop rotation value as well as risk aspects (yield variation, cultivation success, meteorology, ...)
- Price relation (Soy: Maize, .....)
- Competition with specialized crops (vegetables),
- Incentives of Agricultural Policy (Greening, AEM, ..., ↔ farm biogas...)
- Commercialisation costs

# Cultivation Potential D – 1 empirical

- Arable surface: 11,900,000 ha (71% agri surf.)
- Corn for grain: ca. 500.000 ha (4,2% arable)
- Limit in rotation: 25 % (may be 33%)
- CAP-framework: Allowable for Greening-Obligations  
(Factor 1) when without pesticide use
- Eligible as a legume for AEM rotational measures in several regions
- Economic viability (world market; premiums for non-GMO and regional origin in value chains with higher prize levels)
- Logistics (Structures for stocking, processing,...)
- Historic data: Austria had soy on about 30% of grain maize area before entering EU  
= ca. 150.000 ha Soy
- Translated to D

# Cultivation Potential D – 2 discreet

- Discreet estimation: 25% of grain maize area: 125.000 ha ( $\rightarrow$  330.000 t Soja)  
 $\rightarrow$  Soybean area could reach 7-fold the areal of 2015 (about 1% of arable area)
- ... under the condition of further development of interesting value chains for feed and food!

# Cultivation Potential D – 3 natural

According to the soy-suitability map there are in

Suitability Cat.	Arable (ha)	Part in rotation (%)	Soy area (ha)	Yield (t/ha)	Production (t)
Very good	343,000	20	68,000	3.2	220,000
Good	2,788,000	15	418,000	2.7	1,130,000
acceptable	6,000,000	5	300,000	2.5	750,000
<i>Total</i>	<i>9,131,000</i>	<i>8.6</i>	<i>786,000</i>	<i>2.67</i>	<i>2,100,000</i>

→ Soy could be cultivated on up to 30 times the surface of 2018  
In total that means 786.000 ha (6,6% arable) and 2.100.000 t prod.

- ... under the condition of further development of value chains for feed and food with interesting prices for soybean famers in an appropriate rhythms.

# Marketing potentials

- At a degree of 5% self-sufficiency in EU, principally no limits...
- ... but big buyers want big lots + supply guaranty all year round, in order to start label-programs.  
→ need for bundling the production of small and medium size farmers....

# Conclusion

- Soya may be cultivated successfully also in northern regions of central Europe – like maize, .... if
- Know how – Transfer / counselling of farmers exists
- Development of value-adding chains is ensured
  - ... plus chances for developing SE-Europe
  - ... and contribution for maintaining a non-GMO cultivation in America (Brazil, Canada, ...)
- Growing offer of food items based on non-GMO-Soya from Europe (rsp. Brazil, ...)
- Finally it's the consumers' decision to buy food on a basis of European non-GMO soybeans → labelling

# Thank you for your attention !
